Sardis

Compliance-first financial infrastructure for AI agents

Seed · 2026
sardis.sh

PROBLEM

AI agents are becoming autonomous economic actors. But giving an agent direct wallet access means uncontrolled spending with no guardrails. There is no infrastructure for policy-controlled agent payments.

SOLUTION

Non-custodial wallets with **deterministic spending policies**, approval workflows, kill switches, and anomaly detection. Sardis is the governance layer between AI intent and financial execution. We do not hold the money. We enforce the boundaries before settlement.

INTEGRATION (4 LINES)

```
from sardis import SardisClient
client = SardisClient(api_key="sk_...")
wallet = client.wallets.create(policy="Max $100/day")
tx = wallet.pay(to="openai.com", amount="25.00")
```

ARCHITECTURE

Control	Execution	Proof
Mandates, policy, rate limits	MPC wallets, stablecoins, cards	Merkle audit, policy evidence

Cross-Rail Moat: Sardis works across Stripe, Base mainnet, Tempo mainnet, and Visa simultaneously. Incumbents only control their own walled gardens. **The CFO wants one policy layer, not four.**

Structural moat: Stripe won't build cross-rail governance because it commoditizes their own lock-in. Coinbase won't govern Stripe payments. Nobody is structurally incentivized to build neutral : except us.

Fail-closed
If policy, approval, or compliance signals are missing, execution stops.

Non-custodial
Turnkey handles signing. Sardis holds credentials and policy, not customer keys.

Rail-agnostic
The same mandate model can govern cards, stablecoins, and protocol payment flows.

WHAT TEAMS BUY FIRST

STEP 1	A developer adds Sardis to let an agent spend safely in sandbox or staging.
STEP 2	Production rollout pulls in approvals, audit exports, and finance/compliance stakeholders.
STEP 3	Revenue expands from developer tooling into controls, workflows, and enterprise assurance.

BUSINESS MODEL

Free: $0 (SDK, testnet, 1 agent). **Dev:** $49/mo (mainnet, 2 agents). **Starter:** $199/mo (25 agents, compliance). **Growth:** $499/mo (100 agents, audit trail). **Enterprise:** Custom + BPS. Plus 24 API endpoints earn per-request revenue via MPP ($0.001-$0.10/call).

No custody. No MTL required. 93% gross margin per $100 tx.

ASK

Raising a $1.5-2M Seed (18 months runway, Series A milestones by Month 12 with 6-month buffer). I'm looking for a lead who knows how to recruit killer Enterprise GTM talent and navigate SOC2/regulatory compliance. I will handle the code; I need a partner for the boardroom.

Use of funds: Forward Deployed Engineer, Enterprise GTM Lead, Tier-1 Security Audits (SOC2 + code audit).

Series A readiness: $50-75K MRR + governing $10M+ in monthly agent spend (TPV).

WHY NOW

The timing signal is concrete: the standards and rails started arriving, but the control layer is still missing.

Apr 2025	Mastercard launched Agent Pay, validating agents as a real payment endpoint.
May 2025	Coinbase launched x402, making machine-readable stablecoin payments more practical.
Sep-Oct 2025	Google AP2 and Visa TAP pushed intent and identity forward, but neither solves deterministic spend control.

Sardis fits here: above the rail, before settlement, deciding whether an agent is allowed to spend at all.

TRACTION

50K+ installs, $0 marketing **48** packages **2,000+** commits

50K+ organic installs with **$0 marketing spend**. This is developer pull, not revenue. The next step is converting design partners into paid production users.

Activepieces LIVE · MCP Server · Stripe Crypto Onramp · Chainalysis · Scorechain · Stripe ACP · OpenClaw · AutoGPT · CrewAI · Vercel AI SDK · Composio (awaiting review)

> *AutoGPT: package shipped and in discussion. Activepieces: live in marketplace. Composio: tool submitted, awaiting review.*

Production access on Stripe MPP. Stripe ACP integrating.

PROOF OF BUILD

CORE	47+ API endpoints, 48 published packages at v1.1.0, 2,000+ commits, 7 protocol implementations. All built solo.
DISTRIBUTION	Activepieces LIVE in marketplace. MCP server published. 18+ framework integrations. Listed on mpp.dev/services.
BUYER PATH	Developers install first. Production deployment later pulls in approvals, finance controls, and audit requirements.

FOUNDER

Efe Baran Durmaz, 20. Top 0.04% nationally, Bilkent full merit scholarship, Nokia AI Engineer. Polyglot (Python, TS, Rust, Go, Solidity, Java, C++) who ships faster than Series A engineering teams. 49 public repos because I build obsessively. Sardis is my life's work.

"WHAT YOU NEED TO BELIEVE"

AI agents will become the primary economic actors of the next decade, and existing payment rails will never build cross-platform deterministic controls for them.

REASONS NOT TO INVEST

1) Solo 20-year-old, single point of failure. **2)** Early revenue: micropayments via Stripe MPP. **3)** Platform dependency: we sit on top of Stripe, Coinbase, and Visa.

ECOSYSTEM

Live: Activepieces · MCP Server · Stripe Onramp · Chainalysis · Scorechain

Building: Stripe ACP · Coinbase x402 · Base · Tempo · OpenClaw

MILESTONES

M3: First paid pilot. FDE + GTM hired. **M6:** 5+ partners. SOC2. $10-15K MRR.
M12: **$10M+ agent TPV.** 50+ customers. **M18:** Series A. $50-75K MRR.
